Pond Pack Application Tips

Thank you for purchasing an Outdoor Water Solutions Pond Pack(s). For general application, please follow the instructions below

Step 1: Lake & Pond Water Clarifier

Day 1

- Apply at the rate of 10 lbs. per $\frac{1}{4}$ acre of water.
- Broadcast evenly across the surface of the pond, by hand or with the aid of a hand held fertilizer spreader or coffee can. If using to remove suspended particles, dissolve in tap water and spray evenly across the pond surface.

Step 2: Lake & Pond Dye

Day 1

- Throw in 1 packet for a $\frac{1}{4}$ acre pond with an average depth of 4 feet.
- Re-treat in 30-90 days depending on amount of rainfall, pond depth and amount of water disturbance.

Step 3: Lake & Pond Bacteria

Day 1

- Initial application of 4 packets for a $\frac{1}{4}$ acre pond once water temperature has reached 50 degrees F.
- Re-treat with 2 packets per $\frac{1}{4}$ acre pond every 2 weeks.
- For best results throw the water soluble packet into the pond close to your aeration system. If you don't have an aeration system, throw packet into deeper part of pond.
- **For ponds that have excessive sediment (black organic matter) on the bottom or are prone to algae, you may want to double the application rate of the bacteria for best results.**

Note: We recommend using the Pond Packs as a natural solution to help prevent pond problems from occurring. If you have historically had a lot of algae in your pond, it may take some time for this program to work. If you do apply a copper based algaecide for initial control of algae, it is best to wait at least 24 hours before beginning the Pond Pack treatment program.

For ponds larger than $\frac{1}{4}$ acre, you may need to purchase multiple Pond Packs to get season long performance.
